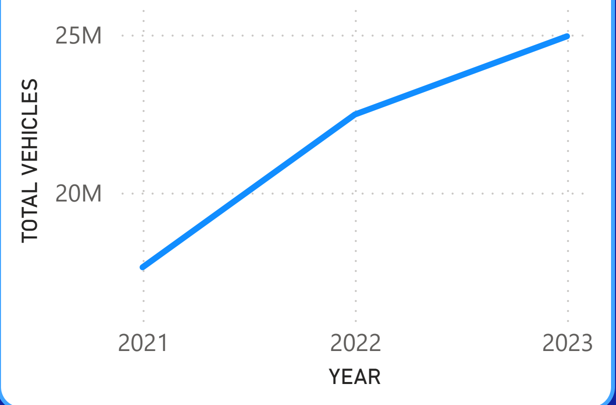
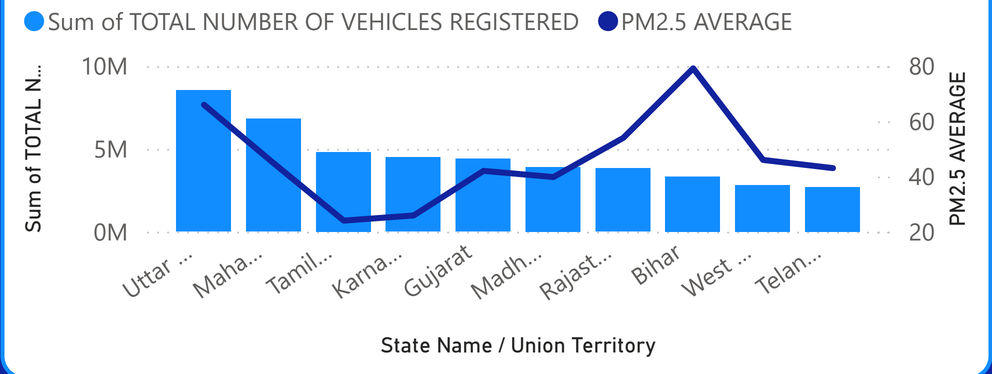
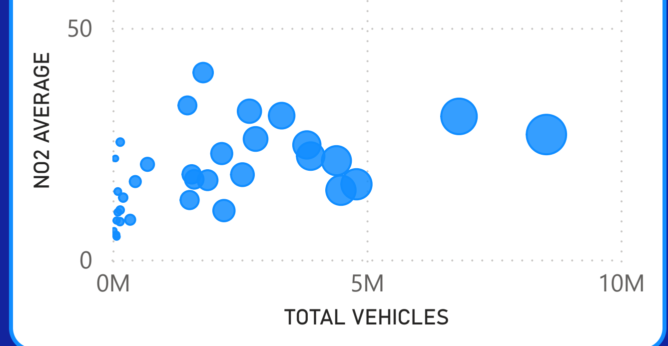
VEHICLE GROWTH OVER THE YEARS



TOP 10 VEHICLES WITH HIGHER VEHICLECOUNT AND THEIR POLLUTION ANALYSIS



STATE-WISE CORRELATION BETWEEN VEHICLE COUNT AND AVERAGE NO2



Key Inferences from this page:

- The analysis indicates a continuous increase in vehicle registrations over the years across most Indian states, reflecting increase in dependence on private transportation.
- Even though a clear linear relationship between total vehicle registrations and AQI indicators is not observed, the analysis reveals that among the top 10 states/UTs with the highest vehicle count, 6 states/UTs exhibit PM2.5 concentrations above the prescribed annual safe limit. This suggests that vehicular growth may be a significant contributing factor to deteriorating air quality in several regions.
